mylatexformat

Use mylatexformat to make a format based on the preamble of any LaTeX file

FC

2011/02/12 – version 3.4

Abstract

mylatexformat can be used to make a format from the preamble of any LaTeX file. The use of formats helps to speed up compilations: packages which have been dumped in the format are loaded at very high speed. A format (also known as *dump*) is therefore very suitable:

– if you have many documents that share the same preamble,

– if you have a document which loads a large amount of packages (like TikZ graphics libraries).

mylatexformat will dump all definitions until `\begin{document}` or `\endofdump`, more precisely:

```
\RequirePackage{...}
\documentclass{...}
\usepackage{...}
 ...
 ...
\begin{document}
```

```
\RequirePackage{...}
\documentclass{...}
\usepackage{...}
\endofdump
 ...
\begin{document}
```

```
\RequirePackage{...}
\documentclass{...}
\usepackage{...}
\csname
endofdump\endcsname
 ...
\begin{document}
```

The colored parts correspond to the format. The `.log` file will report:

```
start reading document "my document"
on input line *** (\begin{document})
```

```
start reading document "my document"
on input line *** (\endofdump)
```

mylatexformat was primarily written from mylatex by David Carlisle, but it is different in many points (see 3). In particular, mylatexformat allows to put almost any package in the format, with one exception: the package minitoc cannot be included in the format (you must use `\endofdump` before `\usepackage{minitoc}`).

Contents

This documentation is produced with the `DocStrip` utility.

⟶ To get the package, run: `etex mylatexformat.dtx`

⟶ To get the documentation run (thrice): `pdflatex mylatexformat.dtx`

To get the index, run: `makeindex -s gind.ist mylatexformat.idx`

The `.dtx` file is embedded into this pdf file thank to embedfile[1] by H. Oberdiek.

1 Creating a format

1.1 Using MikTeX

1.1.1 With preloaded pdflatex format (pdf output)

Use the following command line:

```
etex -initialize [opts] "&pdflatex" mylatexformat.ltx """abc.tex"""
```

You need 3 quotes around your `.tex` file if its name contains space (only one quote if it does not contain any space, but 3 quotes is more general...)

Full example:

```
etex -initialize -save-size=20000 -stack-size=20000
                 -jobname="The-Name-Of-The-.fmt-File(without .fmt extension)"
                 "&pdflatex" mylatexformat.ltx """Mon Fichier TeX.tex"""
```

1.1.2 With preloaded latex format (dvi output)

Use the following command line:

```
etex -initialize [opts] "&latex" mylatexformat.ltx """abc.tex"""
```

1.1.3 With preloaded format xelatex (pdf output)

Use the following command line:

```
xetex -initialize [opts] "&xelatex" mylatexformat.ltx """abc.tex"""
```

1.2 Using other distributions

As I pointed out in the `abstract`, I have not been able to test the file on other distributions.

Some users told me they typed the following command line:

```
latex -ini -jobname="fmt-file-name" "&latex" mylatexformat.ltx  """abc.tex"""
```

2 Using a format

2.1 Using MikTeX

Add the format to the very first line of your LaTeX file :

```
%&"Mon Beau Format"
```

You may use the ε-TeX option : `-dont-parse-first-line` to avoid loading the format.

2.2 Using other distributions

As I pointed out in the `abstract`, I have not been able to test the file on other distributions.

3 How does it work ? (and why it is different from mylatex.ltx)

mylatex.ltx has three important limitations:

1) The end of the format is either `\begin{document}` or the comment `%mylatex`
   Therefore, after the format has been loaded, TeX checks the commentaries in the preamble in order to skip everything before `%mylatex`.
   But this way, braces **must match inside commentaries !**

2) mylatex.ltx temporarily redefines the command `\document` in order to stop the creation of the format (execution of `\dump`) at begin document.
   However, the **initial definition of the macro `\document`** is saved and reloaded after the format has been loaded.
   Therefore, packages that modifies this macro (such as auxhook[2] or etoolbox[3] cannot be included in the format!

3) If your document starts with :
   `\begin{document}% commentary` or with :
   `\begin{document}\makeatletter`
   the format is not stopped at `\begin{document}` and an error occurs.

With mylatexformat.ltx, those limitations are lifted.

mylatexformat.ltx:

1) Temporarily redefines `\begin` in order to check if its argument is ⟨*document*⟩.
   Therefore, packages like auxhook or etoolbox can be included in the format.

2) Stops the format when it encounters `\begin{document}` or `\endofdump`.

3) Does not read inside commentaries

4) After the format has been loaded, each line is checked to see if it **contains** either:

   `\begin{document}`

   or: `\endofdump`

   or: `\csname endofdump\endcsname`*

   Report is written in the `.log` file, with the job name, the name of the preloaded format, the list of preloaded files and the first input line read after loading of format.

* this way, the command `\csname endofdump\endcsname` is silently ignored (equiv. to `\relax`) in case the format is not used.

2. auxhook: CTAN:macros/latex/contrib/oberdiek/auxhook H. Oberdiek
3. etoolbox: CTAN:macros/latex/contrib/etoolbox P. Lehman

4 Implementation

```
1 ⟨*package⟩

47 %%% ^^^^^^^^^^
48 %%%
49 %%% In fact, 3 quotes are necessary only if you "file name.tex" contains a space !
50 %%%
51 %%% -=-=-=-
```

```
%%% ^^^^^^^^^^^^^^^^^                                          USING MikTeX
%%% Add the format to the very first line of your LaTeX file :
%%% --> first line :       %&"format file name"
%%% without the .fmt extension.
%%% [You may use the option :    -dont-parse-first-line option
%%%  to avoid loading the format]
%%% ------------------------------------------------------------------------
%% ________________________________________________________________________
%% The following informations come from mylatex.ltx from David Carlisle:
%% Given a LaTeX file 'abc.tex', use initex as follows:
%%
%% initex &latex  mylatexformat.ltx abc      (Generic TeX)
%% initex \&latex mylatexformat.ltx abc      (unix and other TeX's)
%% tex /i &latex  mylatexformat.ltx abc      (emtex)
%%
%% If you are on a Mac or using some shell that makes it inconvenient
%% to use a command line such as the above examples then you may
%% make a file 'mylatex.tex' with the single line
%% \input mylatex.ltx abc
%% and then pass the file mylatex.tex to your (ini)tex shell to produce
%% the format, ie something equivalent to initex &latex mylatex.tex.
%%
%% If you are using OzTeX, see the separate instructions below.
%%
%% This should make a format file mylatex.fmt which you can then use
%% as follows
%%
%% Using the new format
%% ^^^^^^^^^^^^^^^^^^^^
%%
%% tex  &mylatex abc          (generic TeX)
%% virtex \&mylatex abc       (Unix TeX)
%%
%% This will process your document, abc.tex, just as LaTeX does, but
%% quicker as the contents of the preamble will be stored in the
%% format file and will not need to be run each time.
%%
%% If (vir)tex fails to find your mylatex.fmt then it is not searching
%% in the current directory, either modify your TEXFORMATS path (or
%% equivalent) to search '.' or (on unix/dos) use   ./  as in:
%% virtex \&./mylatex abc
%%
%% Making and using the format with OzTeX
%% ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
%%
%% Given a LaTeX file 'abc.tex', do this: select 'TeX...' from OzTeX's
%% TeX menu, and go to the folder containing the file 'abc.tex' as if you
%% were selecting the file 'abc.tex'. Then hit the Cancel button - this
%% procedure sets OzTeX's working folder to the one containing abc.tex.
%% Next, select iniTeX from the TeX menu, and type:
%%
%% &latex mylatex.ltx abc
%%
%% This should make a format file mylatex.fmt which you can save in the
%% same folder as the file you're working on.
%%
%% To use the new format, put this at the very start of the very first
%% line of your document:
%%
%% %&mylatex
%%
%% Further Notes
%%
%% The file abc.tex must contain a line *just* with
```

```
%% \begin{document}
%% Everything up to (but not including) the \begin{document} will
%% be saved in the format and not executed in subsequent runs.
%%
%% If you are modifying the document (or working on a similar document)
%% you may wish to add new commands to your document preamble.
%% The 'mylatex' format normally skips the whole preamble (believing
%% it to be pre-loaded) and so such new commands do not take effect.
%% You could re-make the format, preloading the new preamble, but that
%% might be inconvenient to do every time, and so an alternative scheme
%% has been introduced.
%% If the preamble contains a comment   mylatex  (ie a line just
%% containing a % white space and the word mylatex) then the mylatex
%% format will start reading the preable at that point so any new
%% commands can be placed after such a comment and they will be
%% executed.
%% ----------------------------------------------------------------------
%%
%%\RequirePackage{etex}% RequirePackage may be used before the class
%%
%% In principle \openout stream= filename need not be space terminated,
%% and need not be immediate, but this covers \makeindex \makeglossary
%% and index package's \newindex which are all the cases of \openout
%% that occur before \begin{document} that I could see.
%% Thanks to Ross Moore for pointing out \AtBeginDocument is too late
%% eg changebar package *closes* the stream in \AtBeginDocument, so need
%% to make sure it is opened before that. Make a special purpose hook.
\makeatletter
```

\begin \begin is overloaded in order to stop \dump at begin document if the macro \endofdump is not given somewhere in the preamble. Rem: it is NOT POSSIBLE to redefine \document, for the macro \document is changed or patched by some classes or packages (auxhook, etoolbox etc.)

With etoolbox[4] version 2.1 and earlier, \begin is patched, in order to insert the hooks \AtBeginEnvironment and \AtEndEnvironment.

Therefore, it's not possible to restore, at end of dump, the orginal definition of \begin in the LaTeX kernel. Instead, mylatexformat inserts a reversible patch of the \begin command: the patched is reversed at end of dump by \MYLATEX@cleanup.

```
%% \begin is overloaded in order to stop \dump at begin document
%% if the macro \endofdump is not given somewhere in the preamble.
%% Rem: it is NOT POSSIBLE to redefine \document, for the macro
%%      \document is changed or patched by some classes or packages
%%      (auxhook, etoolbox etc.)
\begingroup \def\x #1{\endgroup
   \gdef\begin ##1{\MYLATEX@StopAtdocument{##1}#1}
}\expandafter\x\expandafter{\begin{#1}}
\def\MYLATEX@StopAtdocument #1{\expandafter
   \ifx\csname #1\endcsname\document \expandafter\endofdump \fi
}% \MYLATEX@StopAtdocument
```

\openout Files cannot be opened out during the building of the format. Instead, \openout is delayed until the end of the dump.

```
\let\MYLATEX@openout \openout

5 History

[2011/02/12 v3.4]

- Reorganisation of the code + optimisation.

[2011/01/19 v3.3]

- Modification of the code for `\begin` in order to keep the patching introduced by etoolbox version `2.1` for the hooks `\AtBeginEnvironment`...`\AtEndEnvironement`.

[2011/01/14 v3.1]

- `\@for` loop introduced for compatibility with the cmap package had the bad side effect to define a control sequence `\x`. Fixed.

[2011/01/12 v3.0]

- Fix a problem with package cmap which could not be included in the format.
- Documentation revisited after Users' feedback (and the interfaces package).

[2010/08/09 v2.9]

- Modification of the macros that scan the preamble when the `.tex` file is compiled with its format. It is now possible to start a file with `\begin{document}` just after the format specification (`&myformat`).

To do: Command line to make the format on Linux (`-ini` instead of `-initialize` ???).

[2010/06/30 v2.1]

- Added: `\listfiles` is now available in the preamble, after `\endofdump`, when the document is compiled with its format.
- Documentation update.

[2010/05/20 v1.2]

- Fixed a bug in `\MYLATEXopens`
  (There was problems when including an index in the format for example...)

[2010/04/30 v1.0]

- First version.

6 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
