

**NAME**

afm2tfm – convert Adobe font metrics to TeX font metrics

**DESCRIPTION**

PostScript fonts are (or should be) accompanied by font metric files such as **Times-Roman.afm**, which describes the characteristics of the font called Times-Roman. To use such fonts with TeX, we need TFM files that contain similar information. This program does that conversion. For more information, print out the dvips manual.

**FILES**

*psfonts.map* in the config directory used by dvips (update this).

*../afm/Makefile* in the dvips sources (look at this for examples).

**SEE ALSO**

dvips(1), tex(1), vptovf(1)

**BUGS**

An option to add letterspacing to the virtual font was rejected by Knuth because it would make the fi and fl ligatures break the normal rhythmic pattern.

**AUTHORS**

Tomas Rokicki <rokicki@cs.stanford.edu> and Donald E. Knuth
